4.1.3 Relations and Functions

- A function is a set of ordered pairs in which no two ordered pairs have the same x-coordinate.
- The domain of a function is the set of all x-coordinates of the ordered pairs.
- The range of a function is the set of all y-coordinates.

4.1.4 Inverse Relations and Functions

- The inverse relation is obtained by reversing the values of each ordered pair.
- The domain of the inverse is the range of the relation and the range of the inverse is the domain of the relation.
- The graph of the inverse relation is obtained by reflecting the original graph in the line $y = x$.
- To find the equations and conditions of the inverse relation, write x for y, y for x and then solve for y.
- The inverse relation of a given relation is a function if and only if no horizontal line crosses the original graph more than once.
